

My Journey in Creating a Digital Portfolio

On April 13, 2026, I received a final semester assignment to create a personal portfolio website as a collaborative project. I want to share my experience making this website, which honestly gave me a massive headache. Why was it so stressful? Because this process took a long time and was very draining.

It all started in the first week when I designed with Figma. Since I had never tried it before, I was completely confused about where to start and what kind of design to make for my portfolio. I tried looking for references on Pinterest to get an idea of what it would look like. Because I didn't quite understand how to use Figma yet, I felt lost, but I kept trying to create my design by watching tutorials on YouTube.

After struggling to decide on a concept and color scheme, I finally found a maroon and cream combination that made the portfolio design look more alive and attractive. This process was also aided by consultation sessions with Mr. Bagus and Ms. Uli, who helped me choose the best option out of the three design variations I created. Now, with a clear visual direction, I can proceed with the portfolio development with more confidence.

After finishing the design, I reached the stage that gave me the biggest headache: coding with HTML, CSS, and JavaScript. Especially when I had to stare at my code for so long just to find one letter causing an error. I also had to make my code responsive and ensure it didn't look messy. However, when I finally succeeded in finishing the code, I felt a personal sense of pride. I finally finished my portfolio website and managed to submit it before the deadline.

Finally, after weeks of wrestling with design and coding, on May 14, 2026, I was able to upload it to GitHub. Even though it involved a lot of drama, it feels great to be able to submit my code on time. Yes, even though I experienced many obstacles, I feel proud of myself for being able to overcome many hurdles in the process of making this website.
